Supports SQL database. Supports either static IP or hostname addressing. Allows users to select a modem appropriate for the control panel type. It is designed to remotely or locally program specific control panels. Functions Control Panel Management Tasks RPSINTL allows users with a Microsoft Windowsbased computer and a modem to perform remote programming, record storage, remote control, and troubleshooting for specific control panels. Report Capability All report types are fully functional. Users can select a range of pages and either print them or save them as an HTML,.pdf,.rtf,.xls, or.txt file. Contextsensitive and Quick Help Selectable, contextsensitive Help files correspond to the program record sheet items for each control panel. The control panels account window provides Quick Help information regarding the fields in the control panels settings pane. The Quick Help information changes when the cursor moves over the fields. Local and Widearea Network Accessibility RPSLITE uses static IP addresses or a host name, including Domain Name System DNS, to connect to control panels on a localarea network LAN or widearea network WAN. The connection provides fast uploads and downloads. Use this guide as a quick reference. Please contact IMRON Corporation for questions. Typical uses include Typical uses include This unit has replaced the DX4020 and B420. Note If you are using the B426, you must first assign the IP address PRIOR to following the steps below. If you do not know or have not set the IP Address for the B426 Card, please see the following Bosch document for instructions IS2000 Alarm Licensing Ensure that you have the proper IS2000 door license if you wish to utilize alarm panels, including but not limited to Bosch panels. IMRON licenses IS2000 based on the number of doors. The mode of the panel depends on the model of your panel please see the chart above for the panel models and corresponding Modes. Note On a download all from the IS2000 software, the panel might become nonresponsive as the download or import is in progress. Setting Up the Bosch G Series I. Connect the GV Panel to the Network. Note For all network modules B426, B420, and DX 4020, the power comes from the SDI bus of the Bosch panel. Typically, the Bosch panel is wired to a power supply transformer. II. Accessing the Network Page of the Bosch GV Panel Make sure that the Network Gateway DX 4020, B420, or B426 is wired to the SDI 1 peripheral device connector. Reapply power to the controller. If you are using the B420 or B426 Network Module Ensure that the rotary dialer is pointing to the "3". Reapply power to the controller. If you are using the B420 or B426 Gateway, go to section B. Run the Lantronix Device installer application to auto scan for DX4020 devices on the LAN. See Figure 1 Click on " Telnet Configuration " and click on " Connect ". See Figure 8 Unless mentioned below, the other settings shall be kept as default. Press " 9 " followed by " Enter " on your keyboard to save and exit. See Figure 10 Figure 10 This device can be auto discovered by IS2000 on the LAN. Type the Password " B42V2 " and click " Login ". see Figure 12 Set the Legacy TCP automation to " Yes " to enable it. Click " OK " and " Save and Execute " to save the changes. See Figure 13 Unlock the module by clicking the lock in the command toolbar. Right click in the hardware tree and select " Edit " to display the " Add Driver " command from the popup menu. Click on " Add Driver " to view the " Add a New Driver " popup menu. See Figure 14 Click the OK See Figure 15 Configure the Proper Protocol in the properties window as follows See

DO NOT place Legacy and Mode 1 controllers under the same Bosch driver. Figure 16 Select " Edit " and then " Add Controller." See Figure 17 Controllers can be added manually one at a time or you can scan the network and add controllers. If you scan for the controllers with the auto setup tool but cannot see the controller, it is likely that the controller's IP address is set out of the server's reach because they are not on the same subnet. If this is the case, you will have to add the controller manually. Select the controller type here, the appropriate Bosch controller from the drop down menu. Select the Controller Address from the drop down menu and the Controller Group from the drop down menu. b. Click the " OK " button below to continue. See Figure 18 Figure 18 This is typically a local Windows user account that will be used to run the driver as a Windows Service. Click Save. See Figure 19 Usually, an Admin account will have the rights. If using a domain account, enter the full name. In the example below, the full name would be .\Abdul. The domain is set by the IT administrator or the administrator of the local account. Figure 19 The Driver Status Screen should display "Running" in a green box along with the Time Date of the Driver, the Driver Version, and the Firmware Version. When selected, the Bosch panel should show a Online status in the top right as indicated by the green "BOS" box. See Figure 21 Right click on the Controller and select " Controller Command " and click on " Import Utility ". See Figure 22 Make sure to enable each point to start getting the status. The Controller Status Screen should appear with a green "ONLINE" status. See Figure 25 The following example will demonstrate how to add an additional Bosch GV4 panel. Note You MUST keep each panel in its own controller group i.e. one panel per controller group.

If you need two different Bosch panels for example, one GV4 panel and one GV3 panel, you must change the computer name before you can add the same driver. For example, if your computer name is "COMPUTERPC", you will need to change the computer name for the second driver to a different name, such as "COMPUTERPC1". Once the second driver is added, you can change your computer name back to the original computer name here, change "COMPUTERPC1" back to "COMPUTERPC". You will then have two working drivers for the same hardware type i.e. One GV4 panel under one driver and one GV3 panel under a separate driver in the example here. Figure 27 For the legacy Bosch panels, use Mode 0. For the Bosch GV4 panel, use Mode 1. For newer Bosch panels such as the B9512G, use Mode 2. Figure 28 Select the correct GV4 panel and click " OK ". See Figure 29 Note Adding each Bosch panel on its own Controller Group is how the Database of each panel is preserved as an independent unit. Figure 29 Note The import can take 45 to 60 minutes. You know it is an area which includes a pair of intersecting circles and when there arent any other circles that are abutting or touching each other in some way. You can also understand that if two circles intersect in this shape then theyll have two points. The following statement describes the dimensions of the Venn diagram. If two circles are installed to coincide with each other in size and a third ring is put in the centre then the dimension which the fourth ring will occupy is unknown. We can say that the point which makes up the center circle is the largest measurement of this Venn diagram. A definition is essential to discuss this since you could be asking yourself the way to take a look at the center circle. When this is viewed from an orientation angle then it might seem as a square. The lines that we draw the Venn diagram are parallel to the lines which connect the points at the corners of the square. They dont enjoy the fact that it may appear with several different dimensions. Its more pleasing to them to think of a particular Venn diagram with only one dimension. The third and second most intriguing features of this diagram are that each circle is located in the corner of the square.

This means that the middle of this square is a circle and can be found in the corner. There are no empty points. Therefore, this attribute is particularly exciting because it enables us to produce any shape that we need. Now, lets look at the second feature, which is the drawing paper. Youve produced a solid rectangle and you are able to manipulate it using your fingers to make shapes. Do this for a while till you find a pattern appearing. Now draw a place that touches two of the corners of the paper. You will now have one circle and 2 triangles. You can use your fingers to locate the third ring and make the form that you see. The circles are in the corners and are the triangle, but the exterior edges are clearly outlined. Ultimately, we can discuss the center line. The middle line is joined to every one the other lines by curves. Because of this, the lines out the middle line are visually different from the lines within the center line. Creating this diagram is vital because it is going to provide advice to the end user of the software that is needed in order for them to make an educated decision about your goods. It is going to also be helpful to the developer that knows how to utilize the software since it will supply him with all of the details he needs to create his project. To create a UML class diagram, you have to know how to compose the diagram. In order to do this, you want to recognize different areas of the diagram and label them according to their purpose. For instance, you can group items into groups and categories. If you are just beginning, you can start by creating two or three diagrams to explain to you how to create a UML class diagram. After youve created a diagram, then you should have the ability to describe to others what the diagram is about. The final thing you want to remember is that you should never force a person to observe the diagrams.

This wont only hurt your own credibility but additionally, it will ruin the confidence of others who read your articles. People today prefer to see pictures instead of words so you have to make sure that you supply both text and pictures. Its essential that you avoid producing too many diagrams. You shouldnt create a lot of diagrams unless theres a need to do so. Too many diagrams will become

confusing and you will not understand how to arrange them. When you have established the diagrams, its time to understand the overall structure of these diagrams. The very first step is to realize how UML components operate. Now, you should know how youre able to add new components to your diagram. Also, when creating a UML component, you need to be able to determine which part of the part is most significant. If you can specify the most essential part, then youll be able to produce a part which has an entire theme and standard attention. Another way to create a part would be to get it write another element.
